

Threat Hunters Game Summary

Joshua Sourbeer

Threat Hunters is a single player, 3D cybersecurity themed mystery game created using Unreal Engine 5 for PC. You'll take on the role of a newly hired Government IT manager who has been instructed to investigate an incident where sensitive data and personal information was recently removed from the office without authorization. Threat Hunters is designed to train DOD employees and Military personnel on recognizing risk factors derived from the insider threat training program, in accordance with DOD Instruction 5205.16.

Threat Hunters was created to explore interactive and engaging methods to deliver Government training beyond traditional slideshow and textbook based training. In addition, Threat Hunters was developed at zero cost using exclusively open source and freely licensed content; it is designed to provide a blueprint for how training content and interactive games can be developed in house without reliance on expensive long-term contracts or industry timelines.

During gameplay, players will have the opportunity to explore an immersive office environment, interviewing employees and collecting evidence. Threat Hunters is non-linear in nature, meaning that players can complete the game whenever they feel that they've collected enough evidence to file a comprehensive threat report. Threat Hunters was developed over the course of one university semester with about 250 hours spent on total development time.
